PDF Password Checker — Main Flow

Control flow from command-line arguments through candidate selection to the final result.

Password-Checking Flow

Details of `decrypt_pdf` and `try_password`; this is the path called from the main flow.

Candidates run in worker threads, but results are consumed in submission order.
The first truthy result ends the loop; otherwise all futures are checked.
Only pikepdf PasswordError is converted to None; other exceptions propagate.
The supplied snapshot redacts the pikepdf.open password argument, so that line is incomplete as shown.
